Preface

The Library and Documentation Division (LDD) of the National Council of Educational Research and Training (NCERT), serves as a crucial hub for information, research, and academic resources, supporting the diverse needs of educators, researchers, and policy-makers in education. Established to foster an environment conducive to educational excellence and innovation, LDD plays a pivotal role in the dissemination of knowledge and the promotion of advanced learning in the field of academic research. LDD is recognized for its hybrid collection of old and new print collections of books, journals, reports, and other reference collections.

LDD prepares Current Content of the variety of journals on the recommendation of concerned departments and esteemed faculty members of NCERT on related subjects of research like economics, education, psychology, educational research, gender studies, geography, linguistics, mathematics education, physics, science, social science, teacher education, value education, etc.

With the mandate of Prof. Dinesh Prasad Saklani, the Hon'ble Director, NCERT, the Library and Documentation Division executes several specialized services for its patrons known as e*dudoc services*. In this edition of "EDUDOC SERVICES: CURRENT CONTENT," the LDD has delved into and presented a compilation of content pages of the recommended journals by the departments available through ONOS for the month of August 2026. The service facilitates connecting academicians with published articles in journals. For all the journals a hyperlink has also been provided for ease of navigation to the digital contents of the journals. Library and Documentation Division (LDD) at NCERT cordially invites academicians to explore and utilize our extensive collection of the recommended print journals and the journal available through ONOS. Suggestions are solicited to spruce up the library services better in honor of effectively and efficiently serving the academic community.

(Dr. Akash)
Head, LDD
NCERT, New Delhi

AAPT PHYSICS EDUCATION®

In this issue: August 2026

Geraldine L. Cochran, John Essick, Harvey Gould, Claire A. Marrache-Kikuchi, Beth Parks, Daniel Schumayer, Todd Springer, and Jan Tobochnik, Editors

(Received 22 June 2026; accepted 22 June 2026)

https://doi.org/10.1119/5.0349316

These brief summaries are designed to help readers easily see which articles will be most valuable to them. The online version contains links to the articles.

Letters to the editor

"Johannes Vermeer and *The Guitar Player*: Observations on the vibrating guitar string's edge"

Geoffrey D. Schott

94(8), p. 591. https://doi.org/10.1119/5.0338541

"An improved version of the 'extraordinary tabletop speed of light apparatus'"

G. Pegna and G. Malloci

94(8), p. 592. https://doi.org/10.1119/5.0347633

Resource Letter QIE-1: Research in quantum information education

Josephine C. Meyer, Simon Goorney, Tunde Kushimo, and Zeki C. Seskir

94(8), p. 593. https://doi.org/10.1119/5.0306510

The United Nations designation of 2025 as the International Year of Quantum Science and Technology reflects the growing global investment in quantum information science and engineering (QISE) and the rising need for education in this field at all levels. This Resource Letter surveys the literature supporting QISE education, with resources spanning high school (secondary school) through graduate level instruction. The majority of the cited works do not assume familiarity with QISE content beyond a standard middle-division undergraduate course. This list of resources is not intended to be exhaustive or definitive; rather, it offers a curated entry point into the robust and rapidly growing body of literature that has developed in recent years to meet the expanding demand for QISE education.

Problem-solving in physics classes: Navigating fast and slow thinking

Alexander Godunov

94(8), p. 607. https://doi.org/10.1119/5.0269803

Inspired by Daniel Kahneman's dual-process theory, the author developed and tested a six-step problem-solving framework for students in introductory courses. Initial testing showed that students who were required to use this framework in their homework scored significantly higher on the final exam compared to students who were simply exposed to it in lecture. Give it a try in your courses!

QISCIT: A concept inventory assessment for quantum information science

Kelley Durkin, Manshuo Lin, Michael H. Kolodrubetz, and Ryan P. McMahan

94(8), p. 614. https://doi.org/10.1119/5.0287731

This paper describes the development of the Quantum Information Science Concept Introductory Test. This 31-item assessment includes concepts of quantum states, quantum measurement, qubits, entanglement, coherence, quantum gates, and quantum teleportation. It is designed to provide a useful assessment at the high school or university level.

The inverse velocity force and automotive physics

Chris L. Lin

94(8), p. 620. https://doi.org/10.1119/5.0278714

Do you think of your car's transmission as a source of "inverse velocity force"? This article shows why you should! Along with gaining a deeper understanding of transmissions, readers will see how to apply mechanics to cars with both electric and internal combustion engines. Instructors looking for new ways to connect classroom physics to the "real world" will enjoy this paper.

A rigorous derivation of the ideal gas law from energy constraints

Daniele Battesimo Provenzano

94(8), p. 627. https://doi.org/10.1119/5.0323616

The article follows an unusual path in thermodynamics. It offers a purely thermodynamic derivation of the ideal gas law that bypasses both empirical postulates and kinetic theory and shows how the equation of state emerges from simple energy-based constraints. Exploiting the symmetry of thermodynamic potentials, it deepens conceptual understanding of why the ideal gas law is mathematically equivalent to specific energy independences, rather than an external assumption.

Revisiting Koehler's experiment of measuring the ratio of the specific heats of air by self-sustained oscillations

Yujun Shi and Xiaoting Feng

94(8), p. 631. https://doi.org/10.1119/5.0255710

Koehler's experiment is an improvement of Rüchardt's experiment to measure the heat capacity ratio (Laplace coefficient), in which a ball seals a vertical tube connected to a container full of air. If gas is supplied to the container and the air is allowed to escape through a hole in the vertical tube whenever the ball rises above it, the ball may exhibit self-sustained oscillations. This motion is explored here, from both experimental and dynamical-systems points of view. Koehler's experiment is relevant for introductory thermodynamics courses, while the full theoretical and computational analysis could be left for advanced thermodynamics or computational physics classes.

Generalized vibration curves for apodization and super-resolution in far-field diffraction

Lowell T. Wood

94(8), p. 640. https://doi.org/10.1119/5.0300919

This work uses generalized vibration curves to present a unified geometric interpretation of apodization and the resulting diffraction structures. It is appropriate for use in optics courses beyond the introductory level.

Kapitza's pendulum as a classical prelude to Floquet-Magnus theory

Johannes K. Krondorfer, Maria Kainz Matthias Diez and Andreas W. Hauser

94(8), p. 647. https://doi.org/10.1119/5.0295025

Driven systems, that is systems submitted to an external forcing, play an important role in modern physics since time-dependent driving can generate entirely new effective behaviors and even stabilize otherwise unstable configurations. One of the simplest examples is Kapitza's pendulum, where rapid periodic driving stabilizes the inverted, upward position of the pendulum. This article takes this problem as a pretext to introduce Floquet theory and Magnus expansion, which are commonly employed to study driven systems. Floquet theory describes periodically driven systems by separating the dynamics into an effective long-time evolution governed by a Hamiltonian and a periodic micromotion capturing the oscillations at short timescales. This article therefore provides an accessible introduction to the physics of driven systems and the corresponding theoretical methods, useful at the advanced undergraduate and graduate level.

Operator-based derivation of symmetric molecular top wavefunctions

J. Stocker and J. K. Freericks

94(8), p. 655. https://doi.org/10.1119/5.0297905

Introductory quantum mechanics courses often cover the rigid rotor as a model of diatomic molecules. The rotational energy spectrum can be found by solving the Schrödinger equation, and the resulting eigenfunctions are the familiar spherical harmonics. Students interested in modeling more complex molecules with reduced symmetry (for example, a water molecule) will need to become familiar with "symmetric top" wavefunctions, which take the place of the spherical harmonics. In this article, the authors derive these wavefunctions using operator algebra, and provide applications to the physics of water molecules. The article will be of interest to instructors who may want to make more contact between quantum mechanics courses and physical chemistry, as well as to readers seeking inspiration for student projects in this direction.

Tuning interatomic forces with magnetic fields: Feshbach resonances in lithium-6

Ettore Vitali and Gino Edward Gamboni

94(8), p. 664. https://doi.org/10.1119/5.0287600

The Feshbach resonance strongly affects the interactions between atoms in ultracold atomic gases via an applied magnetic field, tuning from a weakly interacting gas to a strongly correlated many-body system. This paper explains the resonance in ^{6}Li at a level appropriate for students whose quantum mechanics course has already discussed scattering theory.

Bloch's theorem: An operator-based derivation

Celal Sirin

94(8), p. 671. https://doi.org/10.1119/5.0310014

When Bloch's theorem is presented in solid-state physics courses, normally the proofs make use of the formalism of periodic structures that has already been derived in the course. This paper presents an alternative demonstration that uses the translation operator and avoids the use of differential equations or the Schrödinger equation. Quantum mechanics instructors who emphasize an operator approach will appreciate this alternative derivation.

A time-domain approach to band formation in periodic media

Nishant Kashyap, Amit Tanwar, Pragati Ashdhir, and Vivek T. Ramamoorthy

94(8), p. 678. https://doi.org/10.1119/5.0345054

This paper explains how band gaps originate in solids by numerically solving the real-space wave dynamics of a simple periodic structure. In addition, the authors discuss the connection between the usual approach using Bloch's theorem for infinite systems and the numerical approach for finite systems.

Tracking the spread of chaos in the swinging Atwood machine

Nick Tufillaro

94(8), p. 688. https://doi.org/10.1119/5.0344894

This paper analyzes the swinging Atwood machine, which can exhibit chaotic behavior, using computational tools-which were originally developed for astronomical simulations. The paper is accessible to undergraduates.

An advanced undergraduate lab on laser noise detection analyzed with a quantum formalism

Haoran Liu, Zhou Fang, Qing Xu, Sujing Cao, Zeliang Wu, Yuan Wu, Jinxian Guo, and L.Q. Chen

94(8), p. 696. https://doi.org/10.1119/5.0298492

Characterizing and understanding noise is fundamental to experiments, and the growing importance of quantum measurement increases the importance of understanding the distinct characteristics of quantum and classical laser noise. This paper describes an undergraduate laboratory exercise in which students learn to identify noise sources by observing how laser noise varies with frequency and power.

The asymmetric rotating saddle potential as a mechanical analog to the RF Paul trap

Aidan Carey, Laurel Barnett, Robert Hart, Anna Klales, Ali Kurmus, and Louis Deslauriers

94(8), p. 702. https://doi.org/10.1119/5.0274638

This paper examines the impact of asymmetry in rotating saddle potentials, a mechanical analog to RF Paul traps used for confining charged particles. The authors demonstrate that even minor asymmetries, such as those from manufacturing imperfections, can significantly alter particle trajectories and stability. This paper is appropriate for advanced E&M classes for educators who wish to connect with topics such as quantum mechanics or quantum technologies. It is also an interesting example of dynamical system and, as such, could be a possible topic for a student project in computing.

Demonstrating dynamic stability with rotating saddles and liquid nitrogen droplets: A classroom analog to the RF Paul trap

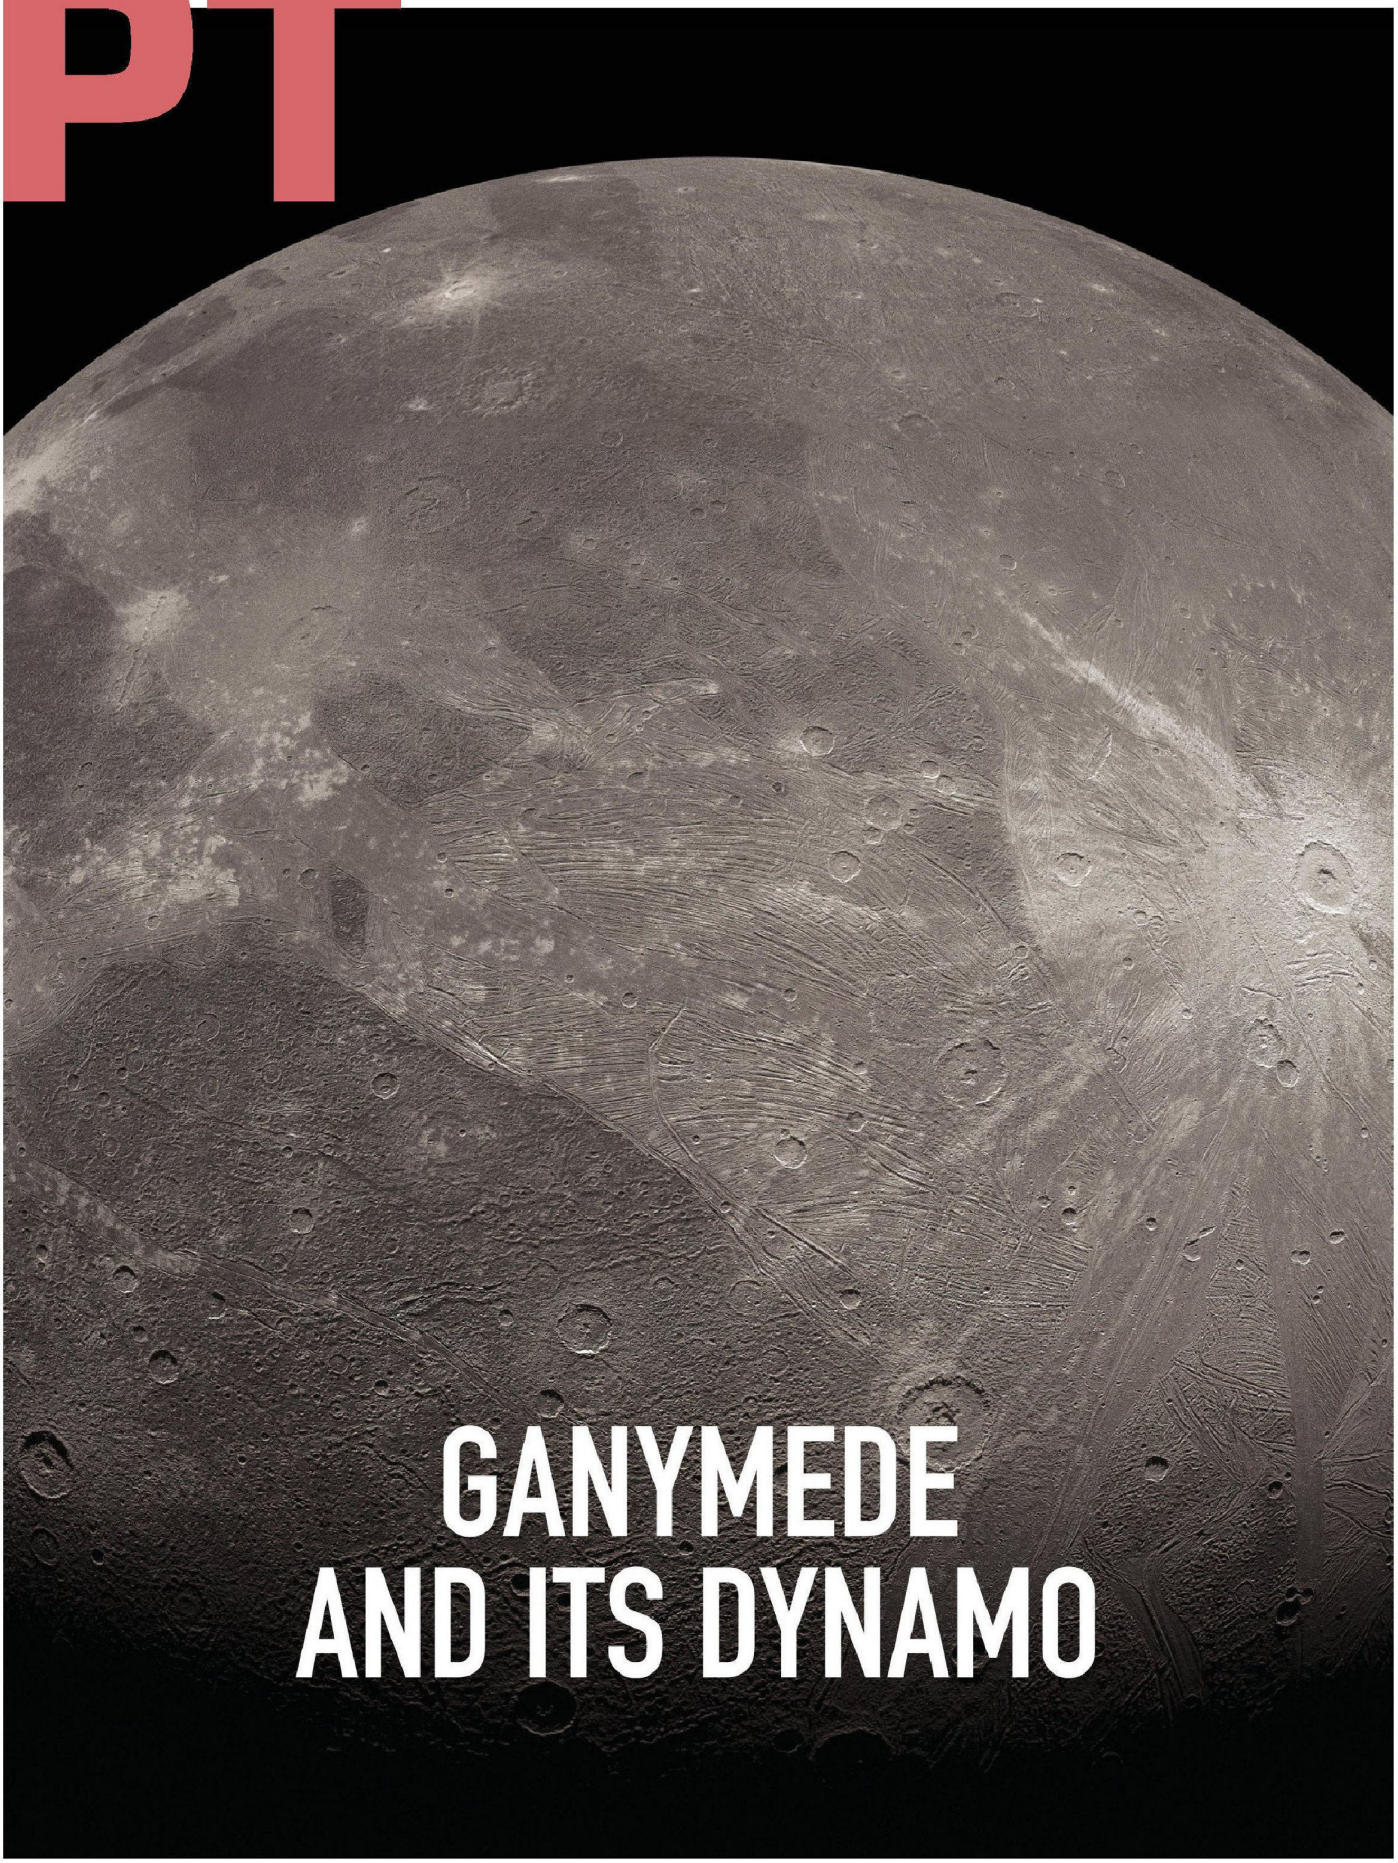

Laurel Barnett, Aidan Carey, Robert Hart, Daniel Davis, Anna Klales, and Louis Deslauriers

94(8), p. 710. https://doi.org/10.1119/5.0279658

This paper describes a classroom demonstration in which liquid nitrogen droplets are used as test particles on a rotating saddle surface to show dynamical confinement, similar to the ponderomotive force experienced by charged particles in a Paul trap. The dynamic stability of liquid nitrogen droplets is shown to be significantly better than that of ball bearings that have been traditionally used in such demonstrations. The authors offer practical guidance on assembling and implementing this enhanced demonstration.

A classical analogue for quantum effects

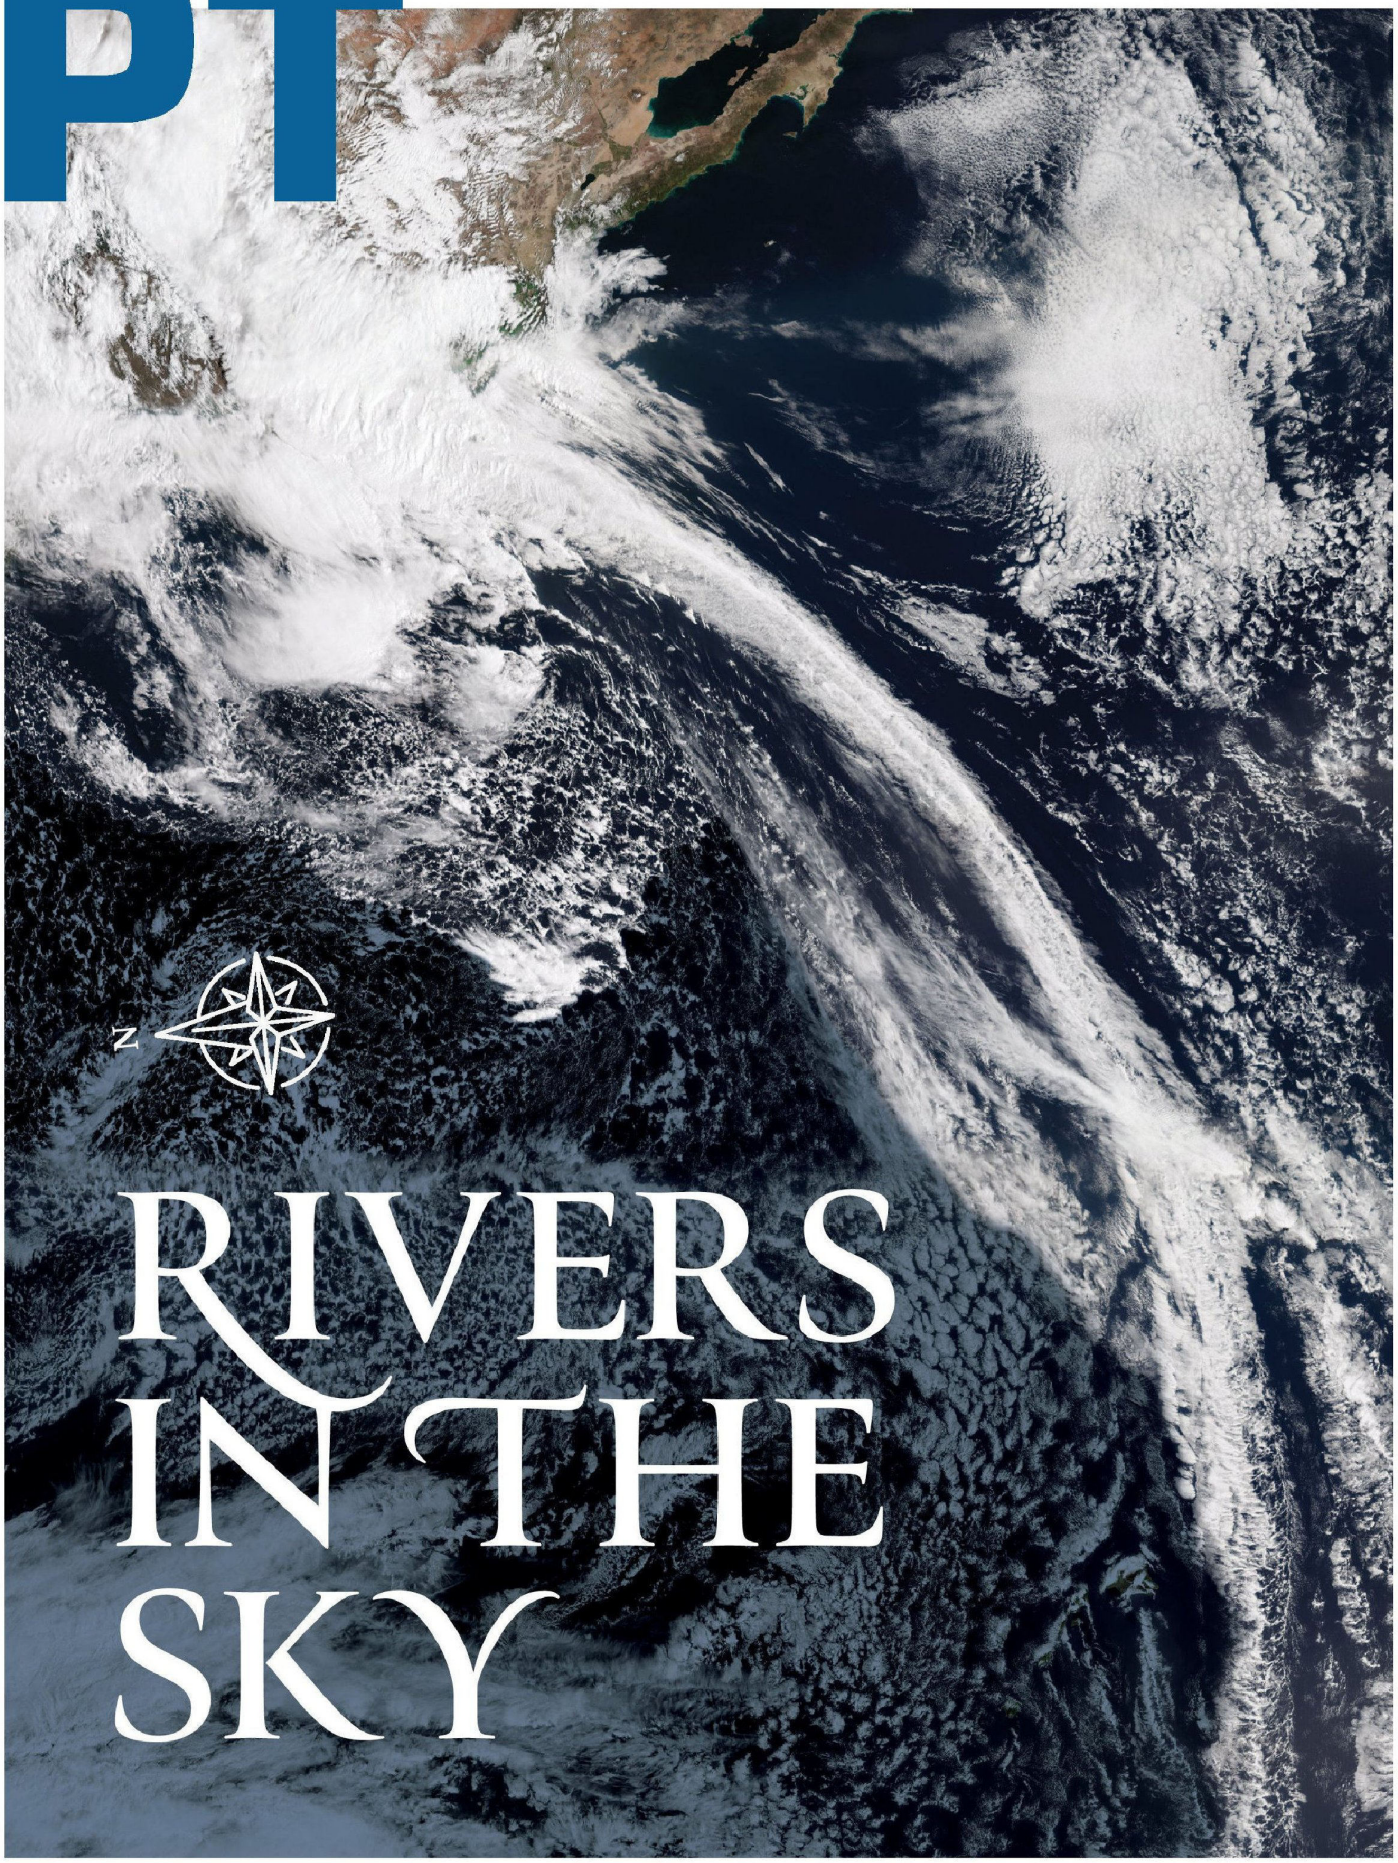

ON THE COVER

The Jovian moon Ganymede is the only moon of the hundreds in the solar system that has liquid metal flowing in its core. The resulting dynamo generates an observable magnetic field. A new model of the moon's slow-forming core shows that Ganymede's dynamo may have developed at a lower temperature than previously thought. The model also offers clues as to why moons similar to Ganymede, including neighboring Callisto and Europa, lack dynamos. To learn more, turn to **page 8**.

ON THE COVER

An atmospheric river—a long, flowing band of concentrated water vapor—formed an arc on 20 February 2017 that stretched from Hawaii to the western coast of the US. The system delivered record-breaking daily rainfall to parts of California during an already wet year, and it caused floods, landslides, and debris flows. See the Quick Study by Serena R. Scholz and Juan M. Lora on **page 44** to learn about the formation of atmospheric rivers and their global impacts under a changing climate.
