\]

Since products of ozonolysis of compound 'A' are \( \text{CH}_3-\text{CH}==\text{O} \) and \( \text{O}==\text{CH—CH}_3 \). The compound 'A' is \( \text{CH}_3—\text{CH==CH—CH}_3 \).

76. Addition of HCl has occurred on 'A'. This implies 'A' is an alkene.

Cl in compound 'B' is substituted by NH\(_2\) to give 'C'.

'\text{C}' gives a diazonium salt with NaNO\(_2\)/HCl that liberates N\(_2\) to give optically active alcohol. This means that 'C' is an aliphatic amine. Number of carbon atoms in amine is same as in compound 'A'.
